

ABSTRACT OF THE DISCLOSURE

In aircraft cargo compartments (2) panels or similar flat floor elements (51) are fastened to floor beams (16) or 5 similar supporting elements that are installed in the body of the aircraft. Subsequently functional units such as roller elements (11), latches (13) or PDUs (14) are mounted and connected to one another by way of appropriate control conductors. To simplify assembly and to reduce the likelihood 10 of errors during assembly it is proposed to fasten the floor elements (51) permanently to the supporting elements (16) so as to form prefabricated floor modules (50), and to install these floor modules (50) in the aircraft.
